Samsung Hiring Team

Re: Image Processing Algorithm Engineer

Dear Samsung Hiring Team,

I am excited to apply for the Image Processing Algorithm Engineer position. Samsung's work in computational imaging - combining mathematics, software, and advanced image-sensor technology - is both fascinating and genuinely revolutionary. It is exactly the kind of work I would be excited to contribute to.

With a degree in Mathematics and Computer Science, I excel at breaking down abstract problems, understanding their underlying structure, and translating mathematical ideas into practical algorithms. For example, while building a video-processing pipeline for panorama construction, I separated the system into feature detection, motion estimation, transformation accumulation, and image alignment stages. This allowed me to isolate numerical errors in the accumulated transformations that were causing alignment drift and improve the pipeline systematically.

My experience includes Python and C/C++, image-processing algorithms, computer vision, numerical methods, and geometric modeling. I have implemented and applied techniques including Gaussian and Laplacian pyramids, multiresolution blending, Shi-Tomasi feature detection, pyramidal Lucas-Kanade tracking, RANSAC-based affine motion estimation, and panorama construction.

I believe this combination of mathematical reasoning, practical software development, and genuine enthusiasm for challenging imaging problems aligns well with the role's requirements. I would welcome the opportunity to learn from and contribute to Samsung's image-processing team.

Sincerely,

Lenny Agizim
